

What is an energy bag?

An Energy Bag is a cable-reinforced fabric vessel that is anchored to the sea (or lake) bed at significant depths to be used for underwater compressed air energy storage. In 2011 and 2012, three prototype sub-scale Energy Bags have been tested underwater in the first such tests of their kind.

Can energy bags be used for underwater compressed air storage?

Conclusions This paper has described the design and testing of three prototype Energy Bags: cable-reinforced fabric vessels used for underwater compressed air energy storage. Firstly, two 1.8 m diameter Energy Bags were installed in a tank of fresh water and cycled 425 times.

Are energy bags a cost-effective energy storage system?

The Energy Bag was re-deployed and cycled several times, performing well after several months at sea. Backed up by computational modelling, these tests indicate that Energy Bags potentially offer cost-effective storage and supply of high-pressure air for offshore and shore-based compressed air energy storage plants.

1. Introduction

Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [1]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations are capable of being used as sites for storage of compressed air.

Are energy bags ready for deployment?

However, as a result of the tests presented in this paper, Energy Bags are now well understood, well developed, and proven in real-world conditions, and are ready for deployment at larger scales within a pilot underwater compressed air energy storage plant.

What is compressed air energy storage?

Compressed air energy storage (CAES) is an energy storage technology whereby air is compressed to high pressures using off-peak energy and stored until such time as energy is needed from the store, at which point the air is allowed to flow out of the store and into a turbine (or any other expanding device), which drives an electric generator.

DOI: 10.1016/J.ENERGY.2013.12.010 Corpus ID: 110098920; Design and testing of Energy Bags for underwater compressed air energy storage @article{Pimm2014DesignAT, title={Design and testing of Energy Bags for underwater compressed air energy storage}, author={Andrew J. Pimm and Seamus D. Garvey and Maxim de Jong}, journal={Energy}, year={2014}, volume={66}, ...

This paper presents a novel isothermal compressed air energy storage (CAES) consisting of two floating

storage vessels in the deep ocean that operates by balancing the pressure of the upper and lower tanks with the oceanic pressure. ... The leftover 58,866 m³ of seawater that needs to leave the upper vessel can be stored in a bag attached to ...

Underwater compressed air energy storage was developed from its terrestrial counterpart. It has also evolved to underwater compressed natural gas and hydrogen energy storage in recent years. UWCGES is a promising energy storage technology for the marine environment and subsequently of recent significant interest attention. However, it is still ...

Compressed-air energy storage (CAES) is a commercialized electrical energy storage system that can supply around 50 to 300 MW power output via a single unit (Chen et al., 2013, Pande et al., 2003). It is one of the major energy storage technologies with the maximum economic viability on a utility-scale, which makes it accessible and adaptable ...

A review of CAES technology can be found in [1,2,3,4,5]. A hybrid system consisting of CAES cooperating with renewable energy sources and potential locations in Poland is dealt with in detail in []. Dynamic mathematical models of CAES systems are presented in [6,7,8,9,10]. Whereas a constant storage volume characterizes the above-described systems, ...

1. Introduction. Compressed air energy storage (CAES) technology can play an important role in the peak shaving and valley filling of power system, large-scale utilization of renewable energy, distributed energy system development and smart grid [1], [2], [3]. However, there exist only two commercial CAES plants in the world, namely, Huntorf plant, operated ...

Compressed Air Energy Storage Maxim de Jong* Thin Red Line Aerospace, 208-6333 Unsworth Rd, Chilliwack, B.C., Canada V2R 5M3 Abstract ... the Energy Bag, air entering the bag must undergo compression to counteract the pressure at the depth of installation. Two thermodynamic cases thereby bound the energy density offered by the Energy Bag system.
