Are ballasted solar panel mounts a risk of roof damage?

Ballasted solar panel mounts present a risk of roof damage due to factors like seismic events, potentially affecting property values and requiring structural assessments. These mounting systems rely on heavy weights to secure solar panels in place, which can exacerbate the impact of seismic activities on the roof structure.

What is the difference between a ballasted and a ground mounted system?

Ballasted mounts are ideal for rooftops where penetration is restricted, as they are secured using weights rather than anchors. On the other hand, ground-mounted systems are versatile and can be adjusted for optimal sun exposure.

Do ballasted solar panels have a roof penetration?

The absence of roof penetration with ballasted solar panel mounts ensures the integrity of the roof structure and simplifies the installation process, often accompanied by warranty coverage.
