

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ( $< 10 \text{ W/(m} \cdot \text{K)}$ ) limits the power density and overall storage efficiency.

What are phase change materials?

Phase change materials are substances that are able to absorb and store large amounts of thermal energy. The mechanism of PCMs for energy storage relies on the increased energy need of some materials to undergo phase transition.

Can phase change materials reduce energy concerns?

Abstract Phase change materials (PCMs) can alleviate concerns over energy to some extent by reversibly storing a tremendous amount of renewable and sustainable thermal energy. However, the low ther...

What are phase change materials (PCMs)?

Systems of TES using phase change materials (PCMs) find numerous applications for providing and maintaining a comfortable environment of the building envelope, without consumption of electrical energy or fuel. Phase change materials are substances that are able to absorb and store large amounts of thermal energy.

What are the selection criteria for thermal energy storage applications?

In particular, the melting point, thermal energy storage density and thermal conductivity of the organic, inorganic and eutectic phase change materials are the major selection criteria for various thermal energy storage applications with a wider operating temperature range.

Can phase change materials mitigate intermittency issues of wind and solar energy?

Article link copied! Thermal energy storage technologies utilizing phase change materials (PCMs) that melt in the intermediate temperature range, between 100 and 220  $^{\circ}\text{C}$ , have the potential to mitigate the intermittency issues of wind and solar energy.

Global energy demand is rising steadily, increasing by about 1.6 % annually due to developing economies [1] is expected to reach 820 trillion kJ by 2040 [2]. Fossil fuels, including natural gas, oil, and coal, satisfy roughly 80 % of global energy needs [3]. However, this reliance depletes resources and exacerbates severe climate and environmental problems, such as climate ...
