

What is the role of polymers in batteries?

Polymers play important roles in batteries as separators, electrolytes, binders and sealing materials. Recently, polymers have also emerged as electrode-active materials in batteries based on fundamental research to create functional polymers for energy storage.

Why are polymer materials used in energy storage devices?

Polymer materials are ubiquitous in these energy storage devices and are commonly used as binders, electrolytes, separators and package coatings to provide structural support, adhesion and mechanical stability to the devices (Fig. 1; Table 1).

Are polymer-based batteries sustainable?

Overall, polymer-based batteries offer some unique properties. High power densities can be achieved, and flexible or even bendable electrodes and, subsequently, devices can be fabricated. The materials utilized do not contain (heavy) metals and open up the possibility for a sustainable battery fabrication.

Can polymer materials improve battery safety?

We also discuss how polymer materials have been designed to create stable artificial interfaces and improve battery safety. The focus is on these design principles applied to advanced silicon, lithium-metal and sulfur battery chemistries. Polymers are ubiquitous in batteries as binders, separators, electrolytes and electrode coatings.

What is a polymer based battery?

Polymer-based batteries typically consist of the electrodes and the electrolyte/separator (see Section 4.4). The electrodes themselves typically consist of three components in different ratios: The active polymer (see Section 4.1), a conductive additive (see Section 4.2) as well as a polymeric binder (see Section 4.3).

Are polymers omnipresent in modern day commercial batteries?

In summary, polymers are omnipresent in modern day commercial batteries and in battery research activities. One important component of batteries is the separator. While porous separators have been commercially available for a long time, gel-polymer electrolytes and solid polymer electrolytes are emerging areas for lithium-ion battery technology.
