Could iron-based batteries save energy?

Form Energy is building iron-based batteries that could store renewable energy on the grid for long stretches, saving up for times when electricity sources such as wind and solar aren't available. Using iron, one of the most common metals on the planet, could help the company build batteries that are cheap enough to be practical.

Are iron-air batteries a new form of energy storage?

Inside a low-slung warehouse near the marshy coast of Berkeley, California, sleek trays filled with iron dust wait to be assembled into a new form of energy storage. The operation belongs to Form Energy, a company seeking to develop the world's first commercially available iron-air batteries. Yes, regular-old iron and air.

Can iron batteries be used for grid storage?

As part of our 10 Breakthrough Technologies series, learn about ESS's ambitious plans to install iron batteries for grid storage around the world. Cheap, long-lasting iron-based batteries could help even out renewable energy supplies and expand the use of clean power.

Can iron-air batteries store electricity for a long time?

The low cost and high availability of iron could allow iron-air batteries to store electricity for several days during periods of low solar and wind power generation. One such iron-air battery is being designed by Form Energy, a company based in Massachusetts that's co-run by a former Tesla Inc. official.

Are iron-based batteries up to the task?

New types of iron-based batteries might be up to the task. Oregon-based ESS, whose batteries can store energy for between four and 12 hours, launched its first grid-scale projects in 2021. Massachusetts-based Form Energy, which raised \$240 million in 2021, has batteries that store power for up to 100 hours.

Are iron-air batteries the future of energy?

Iron-Air Batteries Are Here. They May Alter the Future of Energy. Battery tech is now entering the Iron Age. Iron-air batteries could solve some of lithium's shortcomings related to energy storage. Form Energy is building a new iron-air battery facility in West Virginia. NASA experimented with iron-air batteries in the 1960s.

Recently, iron-air batteries have gained renewed interest for large-scale grid storage, requiring low-cost raw materials and long cycle life rather than high energy density. Institutions like USC, Form Energy, and the European NECOBAUT program are actively researching iron-air battery systems for automobiles and grid-level energy storage.

While iron-air batteries have a round-trip efficiency of around 50-60%, lower than lithium-ion batteries (which

exceed 90%), their key strength lies in long-duration storage. Iron-air batteries can store energy for several days, making them ideal for balancing the intermittent supply of renewable energy sources like wind and solar.

The batteries will allow Xcel Energy to store renewable energy such as solar and wind when it is being produced and then later distribute the energy during periods of lower production. While most existing battery technologies provide fewer than eight hours of energy storage, Form Energy's iron-air batteries could deliver electricity for 100 ...
