

Lithium battery energy storage project summary

Are lithium-ion batteries a good choice for energy storage?

Lithium-ion batteries are being widely deployed in vehicles, consumer electronics, and more recently, in electricity storage systems. These batteries have, and will likely continue to have, relatively high costs per kWh of electricity stored, making them unsuitable for long-duration storage that may be needed to support reliable decarbonized grids.

How much energy does a lithium secondary battery store?

Lithium secondary batteries store 150-250 watt-hours per kilogram (kg) and can store 1.5-2 times more energy than Na-S batteries, two to three times more than redox flow batteries, and about five times more than lead storage batteries. Charge and discharge efficiency is a performance scale that can be used to assess battery efficiency.

Why are lithium-based batteries important?

Lithium-based batteries power our daily lives from consumer electronics to national defense. They enable electrification of the transportation sector and provide stationary grid storage, critical to developing the clean-energy economy.

What is lithium ion battery storage?

Source: Hesse et al. (2017). Lithium-Ion Battery Storage for the Grid--A Review of Stationary Battery Storage System Design Tailored for Applications in Modern Power Grids, 2017. This type of secondary cell is widely used in vehicles and other applications requiring high values of load current.

Are lithium-ion batteries critical materials?

Given the reliance on batteries, the electrified transportation and stationary grid storage sectors are dependent on critical materials; today's lithium-ion batteries include several critical materials, including lithium, cobalt, nickel, and graphite.¹³ Strategic vulnerabilities in these sources are being recognized.

Can lithium ion batteries be adapted to mineral availability & price?

Lithium-ion batteries dominate both EV and storage applications, and chemistries can be adapted to mineral availability and price, demonstrated by the market share for lithium iron phosphate (LFP) batteries rising to 40% of EV sales and 80% of new battery storage in 2023.

Lithium metal batteries use metallic lithium as the anode instead of lithium metal oxide, and titanium disulfide as the cathode. Due to the vulnerability to formation of dendrites at the anode, which can lead to the damage of the separator leading to internal short-circuit, the Li metal battery technology is not mature enough for large-scale manufacture (Hossain et al., 2020).
