Can layered MoS<sub>2</sub> nanostructures be used for energy storage electrodes?

Rational construction of layered MoS<sub>2</sub> nanostructures (nanotubes, nanosheets, nano-flowers) for morphological control and composite of other carbon-based materials is an effective way to develop high-performance energy storage electrode materials.

The value of nominal battery voltage ( $V_{Bat, no min al}$ ) can be determined by the following relation [75], (3)  
 $V_{Bat, no min al} = E_{Cn} / C_n$  where  $E_{Cn}$  is the energy value known as rated energy storage capacity expressed in kilowatt-hours (kWh). Both nominal capacity and rated energy storage capacity are usually related to the beginning of life ...
