

More complex features on the SG500 include an array of options to manage Multicast traffic, as well as detailed support for SNMP communication with network monitoring systems. To understand how Cisco's small business switch series vary in performance, I looked at Cisco 24 port Gigabit capable switches in the 100, 200, 300, and 500 series.

The SG300 and SG500 can meet requirements for stacking (only for 500 series).

Slot Number - The slot number is either 1 or 2. Slot number 1 identifies an SG500 or SG500X device. Slot number 2 identifies an SF500. This section describes the features of the web-based switch configuration utility. The Application Header is displayed on every page.

Devices of type Sx500 or SG500X can either function on their own, or they can be connected into a stack of up to four devices (units). When a unit functions by itself, its stack mode is Standalone. When it functions as part of a stack, its stack mode is Native Stacking mode.

The SG500 can also be configured from the command line via a telnet or sshif enabled. There are 13 configuration menus listed on the left side of the web page, with numerous submenu options in each. A look at the screen presented upon login is shown in Figure 6 below.

For the SG500 and SG1000, at a minimum, you must have a Windows 8 or Mac 10.13 computer equipped with either an Intel or AMD processor. Please see the following link for our full list of System Requirements. Please also note that an internet connection is required during the installation process of the software. Minimum System Requirements.

The 200 series are relatively easy to configure Layer 2 "smart" switches with support for VLANs, QoS, and other options. The 300 series are fully-managed switches and add Layer 3 functionality, meaning they can route traffic at ...
