Can underground storage of compressed air energy be implemented in lined rock caverns?

Underground storage of compressed air energy in lined rock caverns (LRCs) at relatively shallow depths (e.g., 100 m) may broaden the possibility of CAES implementation, because it can be flexibly located at a closer distance from energy sources or users, which can result in a reduction of initial construction costs.

Are salt caverns suitable for underground energy storage?

Salt caverns are suitable for Natural Gas Storage, Hydrogen Storage and Compressed Air Energy Storage [ 16 ]. As for the host rocks, the identification of potential salt reservoirs for underground energy storage should consider multiple factors. 4.2.1. General criteria

Can underground energy storage systems be mined?

On one hand, during construction or operation of underground energy storage systems, water inflow could be so great that mining or operation would be impossible. On the other hand, in arid regions or within the unsaturated zone, absence of both capillary water and water at hydrostatic head may prevent storage within a mined cavern.

What are the challenges in underground storage of compressed air?

One of the key challenges in underground storage of compressed air in LRCs is the risk of air leakage from the storage caverns.

What are underground energy storage and geothermal applications?

Underground energy storage and geothermal applications are applicable to closed underground mines. Usually, UPHES and geothermal applications are proposed at closed coal mines, and CAES plants also are analyzed in abandoned salt mines. Geothermal power plants require flooded mines, which generally have closed more than 5 years ago.

Which underground storage options are suitable for CAEs?

We discuss underground storage options suitable for CAES, including submerged bladders, underground mines, salt caverns, porous aquifers, depleted reservoirs, cased wellbores, and surface pressure vessels. A geomechanical perspective is provided regarding the pressure limits for these options.

1. Introduction. Large scale energy storage (LSES) systems are required in the current energy transition to facilitate the penetration of variable renewable energies in the electricity grids [1, 2]. The underground space in abandoned mines can be a solution to increase the energy storage capacity with low environmental impacts [3], [4], [5]. Therefore, ...

2.3 Calculation Details. To simulate an underground thermal energy storage, thermal boundary conditions are defined. PLAXIS 2D (Bentley Systems, 2020) offers two possibilities either line-based thermal flow boundary

conditions or cluster-related thermal conditions. As the main aim was to simulate a fully heated storage over a calculation time of ...

An analytical solution for mechanical responses induced by temperature and air pressure in a lined rock cavern for underground compressed air energy storage. *Rock. Mech. Rock. Eng.*, 48 (2015), pp. 749-770. Crossref View in Scopus Google Scholar [38] S. Zhou, C. Xia, H. Zhao, S. Mei, Y. Zhou.

Total electricity demand in India is estimated at 10 9 MWh annually [82], therefore the total underground CAES energy storage capacity potential stands at approximately 10 times greater than annual demand if all available land were utilised for this underground storage of air. Thus, although it can be concluded that there is sufficient ...

Development of underground energy storage system in lined rock cavern. Ministry of Knowledge Economy, Seoul. Kim HM, Rutqvist J, Ryu DW, Choi BH, Sunwoo C, Song WK (2012) Exploring the concept of compressed air energy storage (CAES) in lined rock caverns at shallow depth: a modeling study of air tightness and energy balance. *Appl Energy* 92:653 ...

Hydrostor has announced a 25-year project with Central Coast Community Energy (3CE), one of California's largest community choice aggregators that works with local governments, to build a 200 megawatt (MW)/1,600 mega-watt-hour (MWh) underground compressed air energy storage (CAES) facility.

Hydrostor's Advanced Compressed Air Energy Storage (A-CAES) technology provides a proven solution for delivering long duration energy storage of eight hours or more to power grids around the world, shifting clean energy to distribute when it is most needed, during peak usage points or when other energy sources fail.
